

Plan to make SLIMED calibration accessible

Hugh H. Kieffer HHKieffer@gmail.com

SLIMED: A follow-on to ROLO model is published:
Multiple-instrument-based spectral irradiance of the Moon.
Jour. Applied Remote Sensing. Vol. 16, Issue 3
<https://doi.org/10.1117/1.JRS.16.038502> Open Access

- Developed in IDL, requires a license. Need to convert to a public language
 - e.g., Python or some version of C.
- Now making IDL versions aimed at conversion. Generic routines.
 - All files are NetCDF, minimize executable code, more comments.
- Model is defined by the basis function symbols and coefficient values in Table 3 & 5.
 - Any revised model using the same scheme can use the same code!

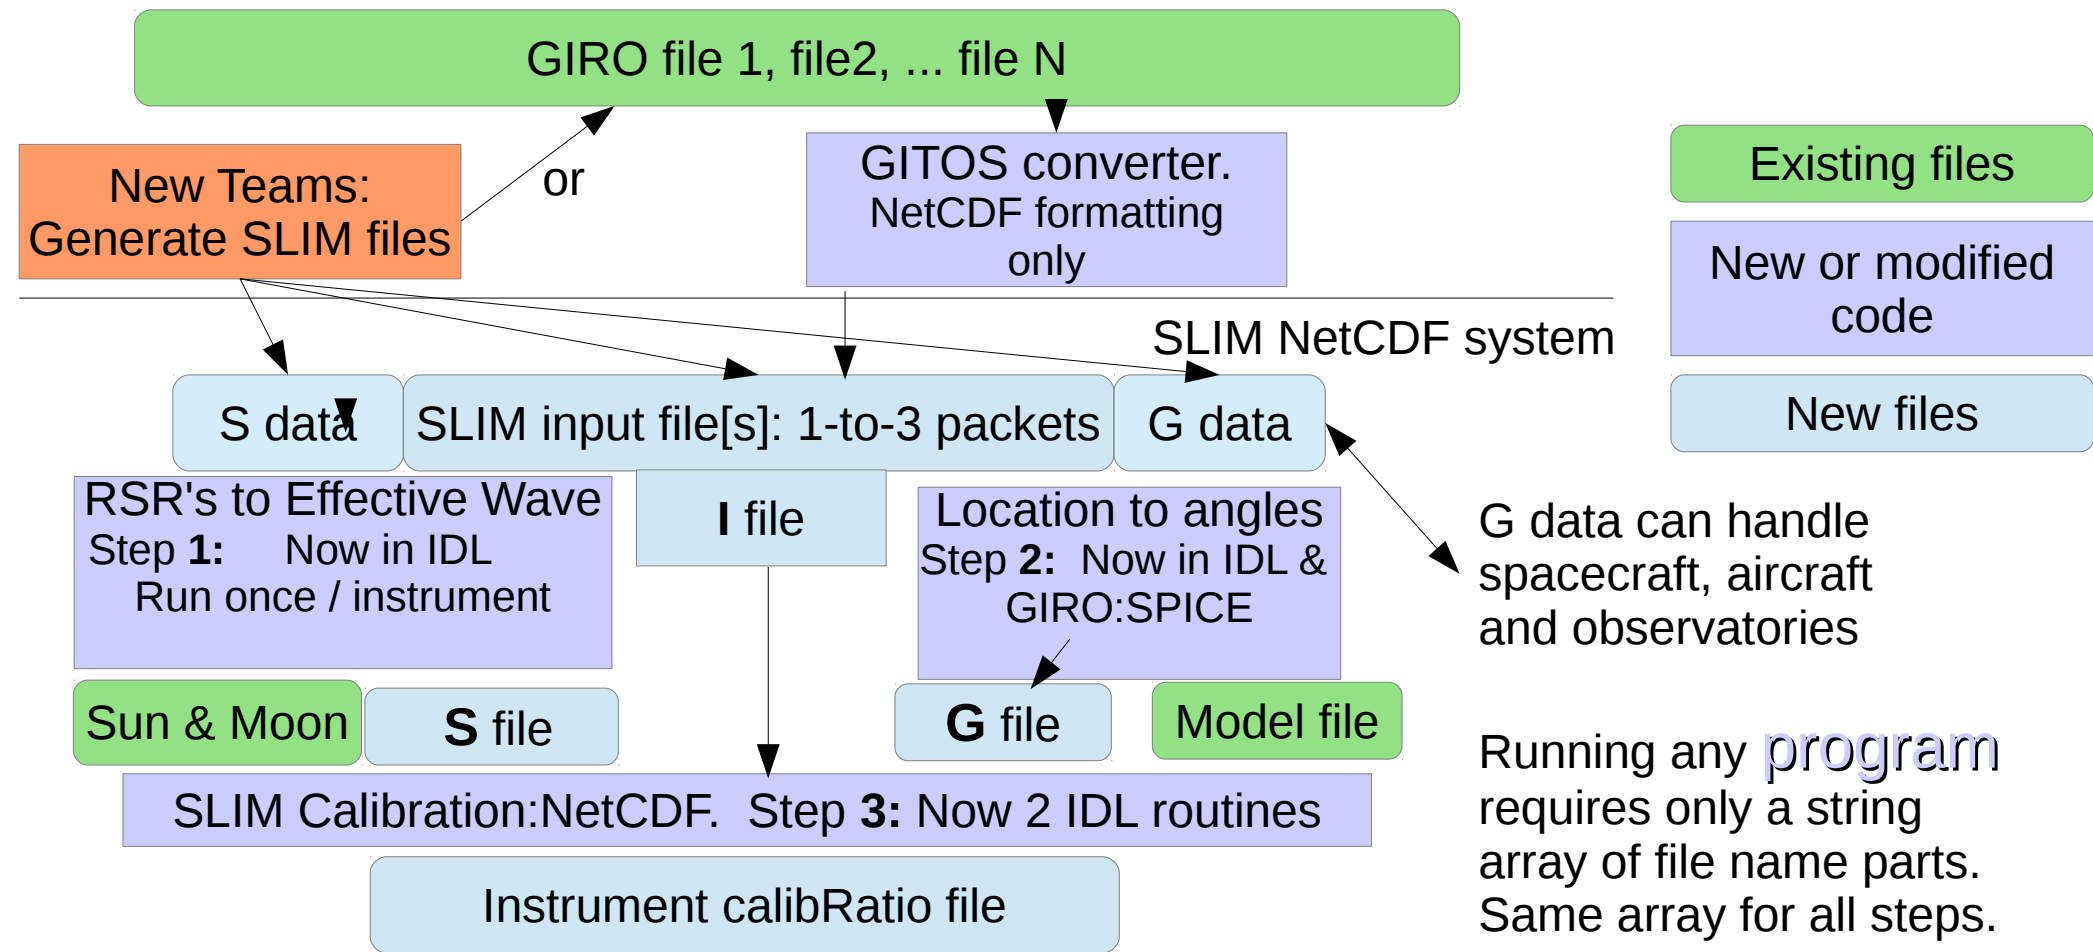

Design principles

- The instrument information needed to do lunar calibration has ***different permanence.***
- Spectral: **S** Band spectral response commonly stable over the life of a mission. Can also include **Stable** information about the spacecraft, instrument, institution and instrument team.
- Geometry: **G** (time and location) Usually static soon after each observation.
- Irradiance: **I** May be computed multiple times as image processing procedures improve.

Multiple Goals. However: restrict to irradiance calibration

- Allow calibration to be run at any institution.
- Minimize the instrument team effort required.
- Accommodate observatories and aircraft, as well as spacecraft
- Keep file sizes small enough for email transfer between institutions.
- Omit everything related to imagerettes
- Optionally allow separation of information based on its permanence.
- Build a GIRO-to-SLIM converter (Tom Stone suggestion).
- One routine should work for all teams.
- I have a draft document that describes all this.
- Everything open to discussion

Flow: SLIM in NetCDF

Coding Task. Which organization can do this ?

- **GITOS:** Reformatting NetCDF files, attributes and variables. Few calculations.
- **1: RSR's to Effective-Wavelength:** [`_wt` to `_ev`]
- Existing IDL code in SLIM. May exist somewhere in the GIRO system.
- Requires two functions:
 - 1) Interpolation of the RSR's onto the uniform proportional resolution system: $\lambda/\Delta\lambda=1000$.
 - 2) Spectral multiplies to form effective wavelength and in-band nominal lunar irradiance.
- **2: Time+location to angles & distance.** Requires JPL ephemeris [`_tv` to `_pg`]
- a) Use the JPL ephemeris directly. Current SLIM IDL + FORTRAN.
- or b) Use the JPL SPICE software system. Current GIRO ? Current SLIM IDL .
- **3: Calibration**
 - Uses NetCDF **S, I, G** files: IDL `slimcal_nc.pro`. 230 lines, all but about 40 are file handling.
 - One IDL subroutine (generic basis function generator): `sid2bij.pro` 82 lines.
