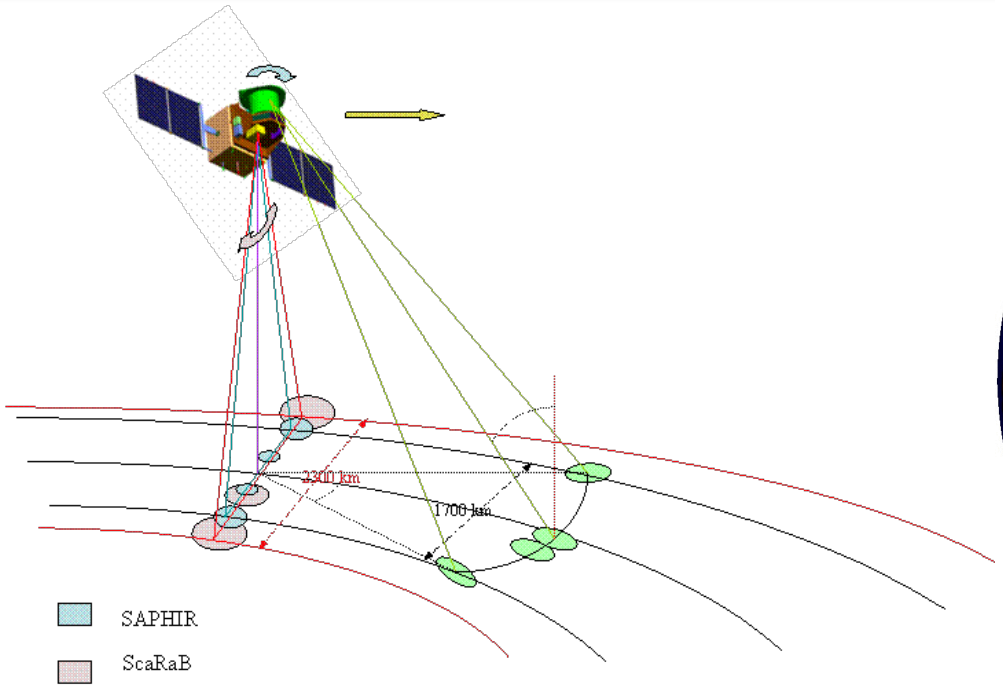
Outline

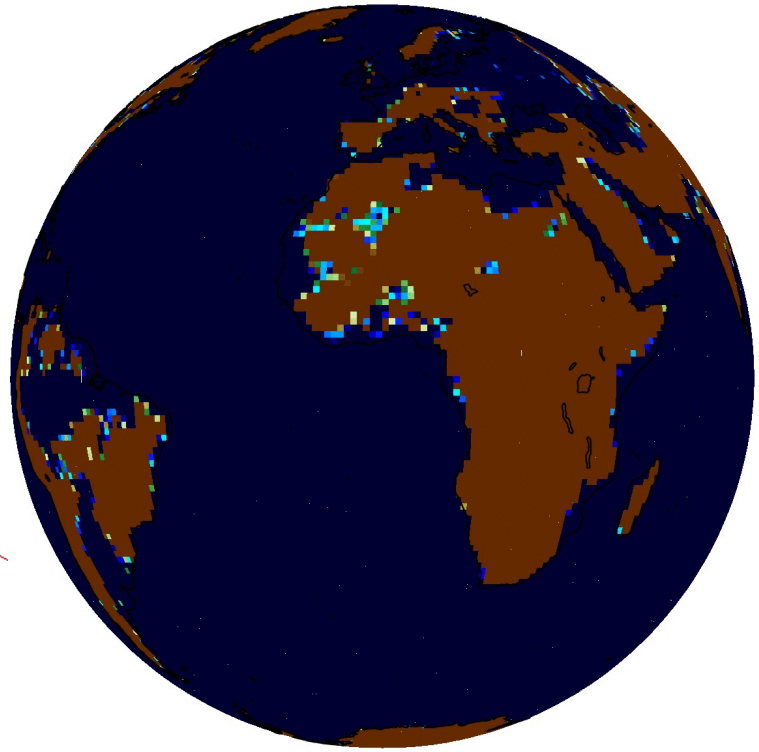
- Radiometric and Geometric Errors
- ATMS and SAPHIR instruments
- Inter-calibrating SAPHIR and ATMS
- Validation verus radiosonde data
- Validation versus GPS-RO profiles
- Geolocation Errors
- Conclusion

Radiometric and Geometric Errors

- **Radiometric Errors**
  - Change in Antenna Reflectivity and Emissivity
  - Imperfect Electronics: APC, Oscillators, Amplifiers, ...
  - Radio Frequency Interference (RFI)
  - Uncertainty in Warm Load Temperature
  - Non-linearity in the Calibration
  - Pre- and Post-processing Errors
- **Geometric Errors**
  - Antenna and/or Feedhorn Misalignment
  - Satellite Attitude Offset
  - Satellite Clock Offset and Timing Error
  - Error in Ephemeris Data
  - Anomaly in Scan-drive Motor
  - Error in Sensor Modelling

Megha-Tropiques

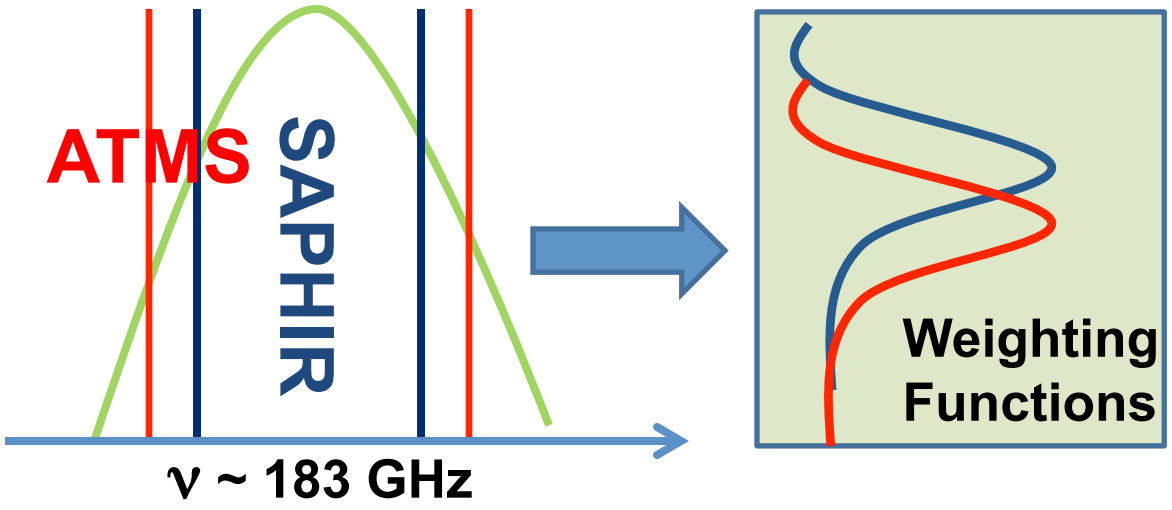


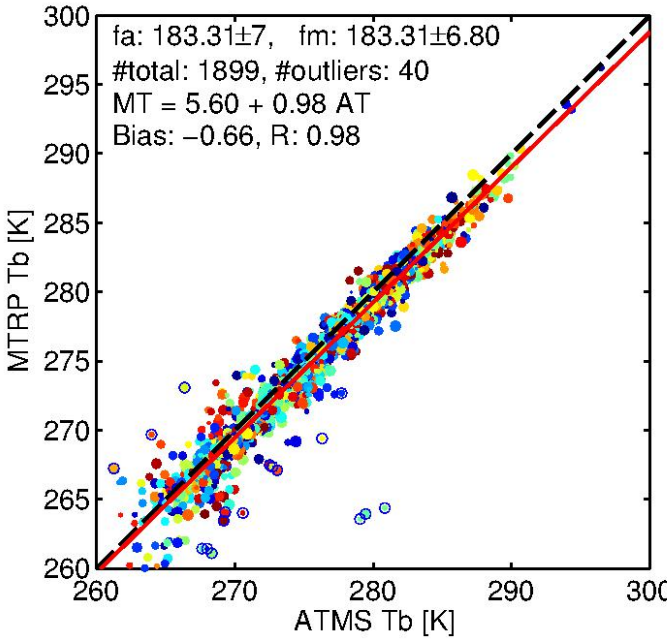


- A microwave imager (MADRAS) to study precipitation and cloud properties (SSM/I type, with an additional channel at 157 GHz).
- A microwave sounding instrument for the atmospheric water vapor (SAPHIR - 6 channels in the 183 GHz band).
- A radiometer for measuring outgoing radiative fluxes at the top of the atmosphere (ScaRaB).

Inter-calibrating SAPHIR and ATMS

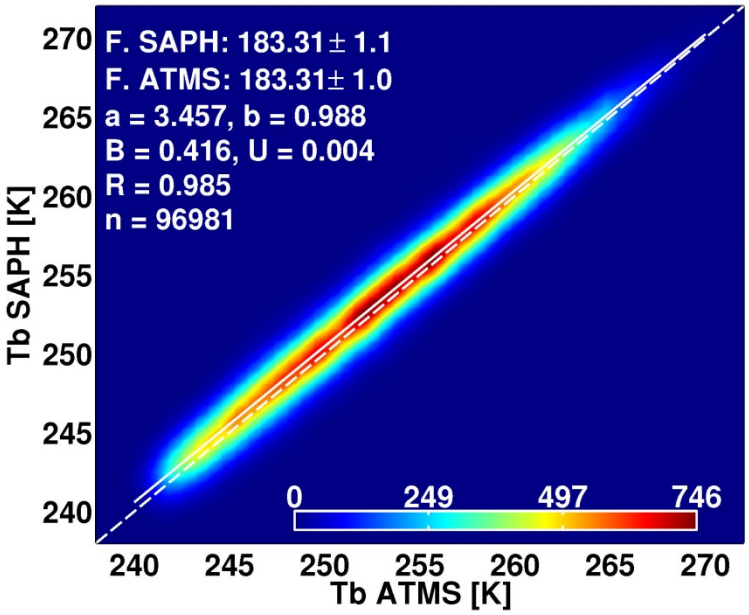
SAPHIR vs. ATMS

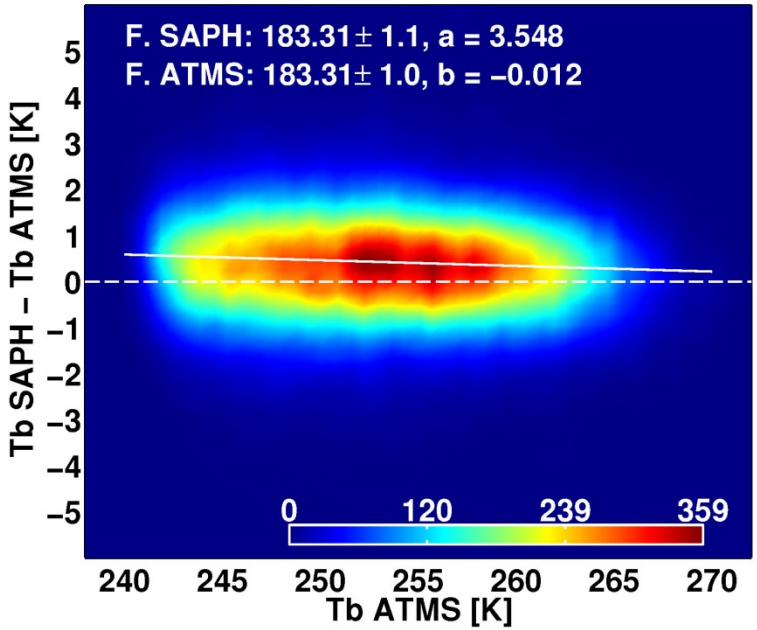


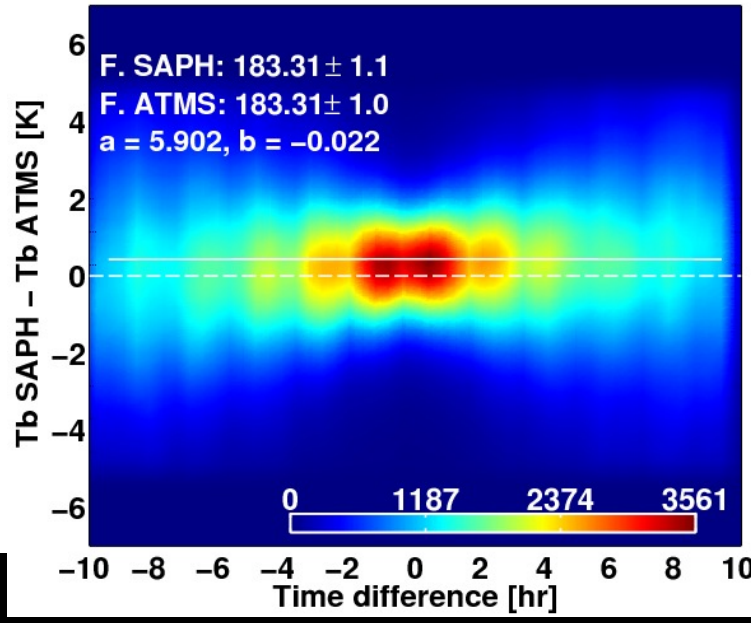


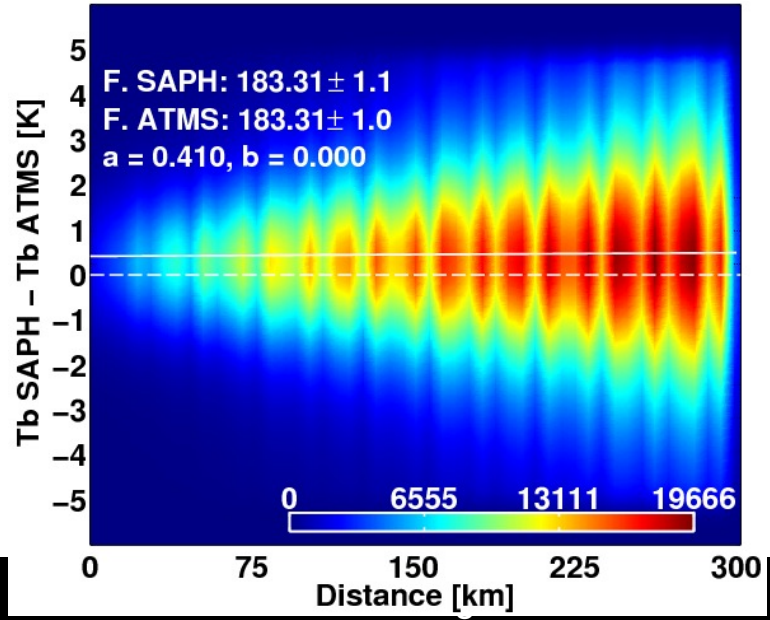
ATMS	SAPHIR	Bias (Obs)	Bias (Sim)	Obs - Sim
183±7.0	183±6.8	-0.68	-0.42	-0.26
183±4.5	183±4.2	-1.56	-0.91	-0.65
183±3.0	183±2.8	-1.23	-0.93	-0.30
183±1.0	183±1.1	+0.42	+0.90	-0.48

SAPHIR vs. ATMS



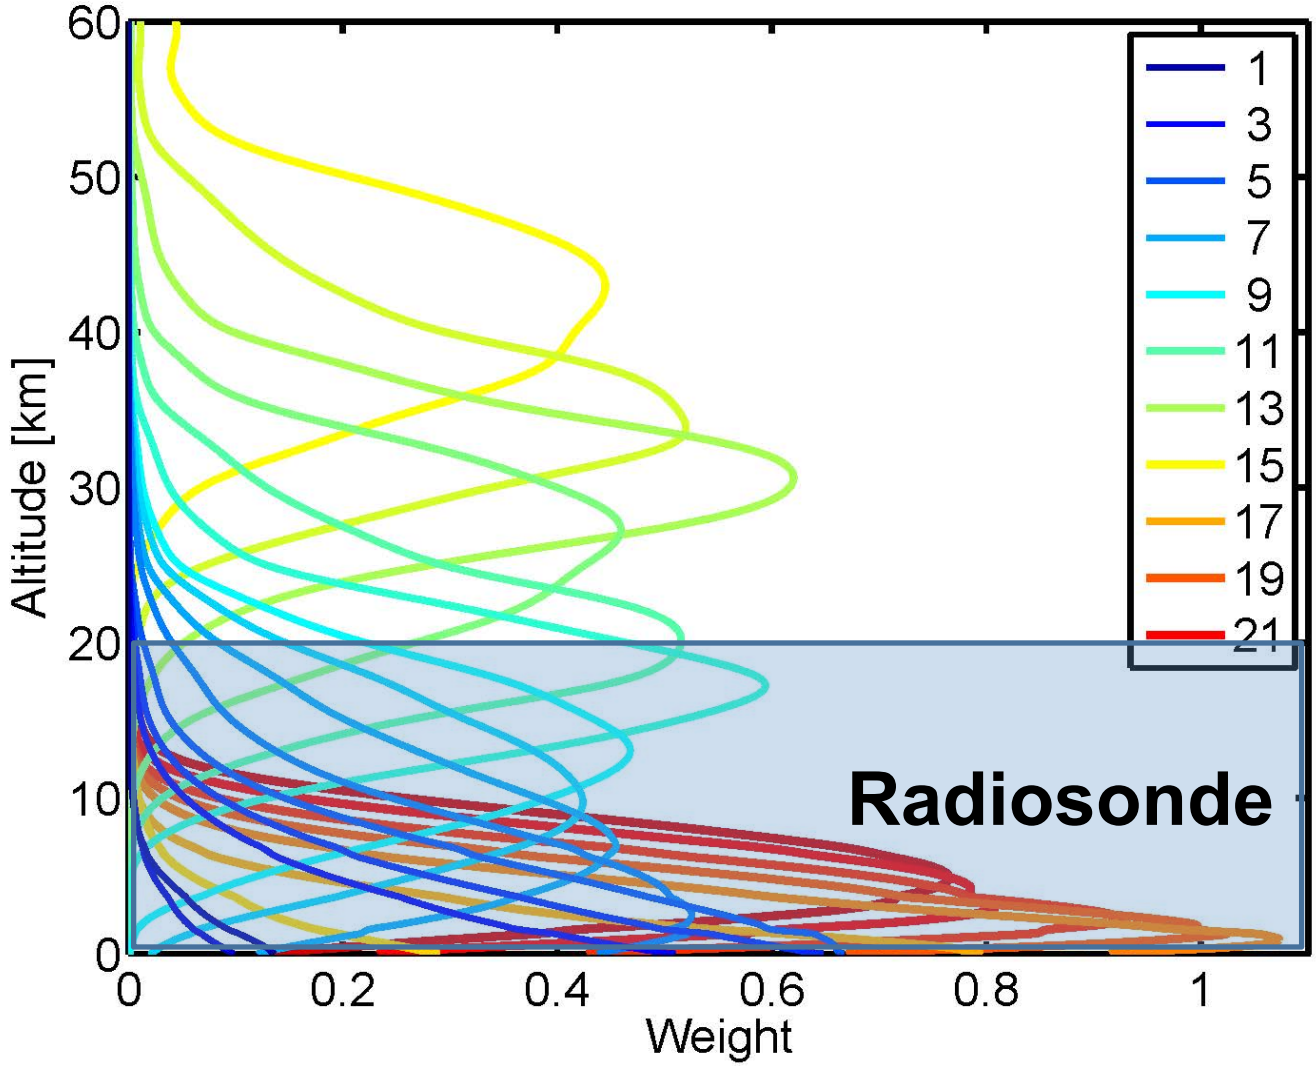




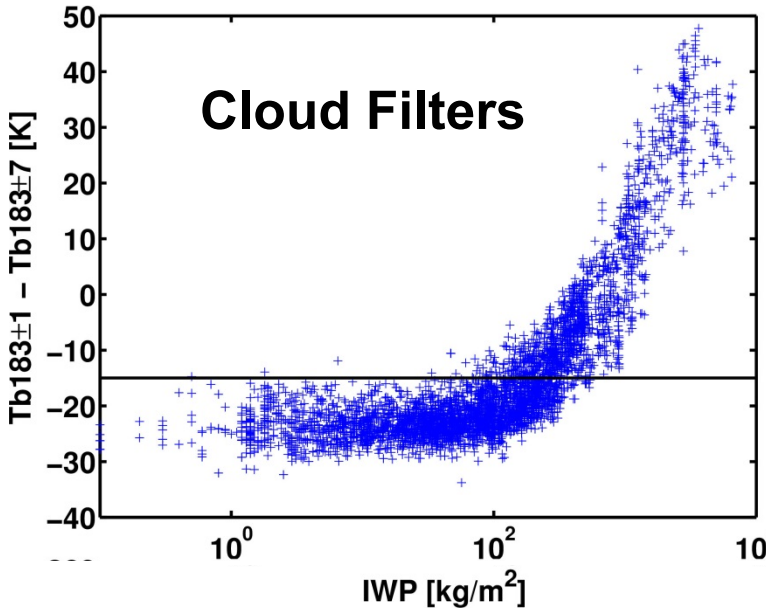


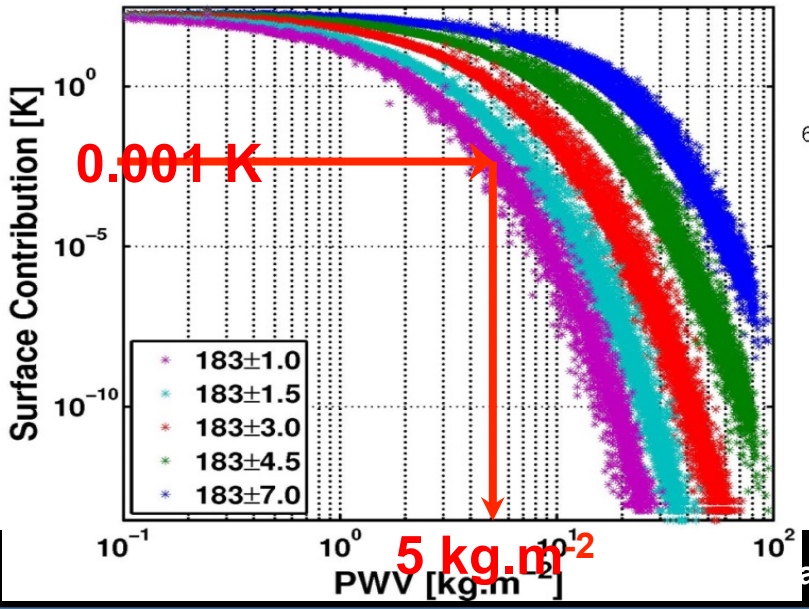
Validating using radiosonde data

ATMS Weighting Functions

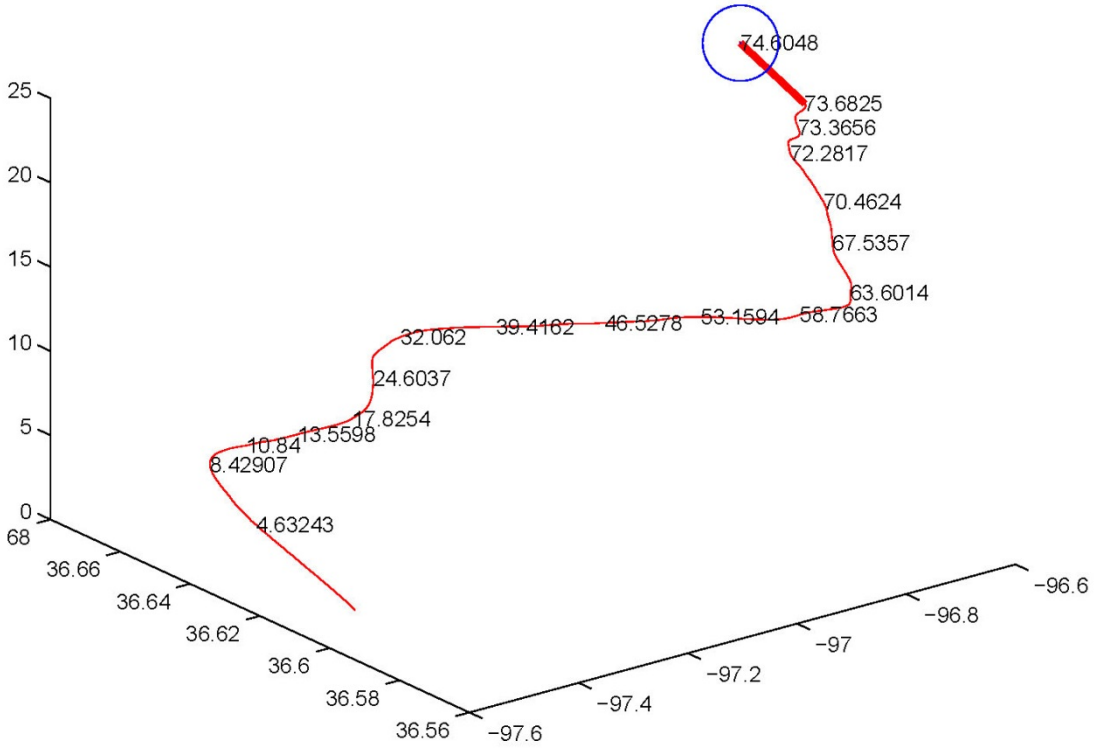


Cloud and PWV Filters

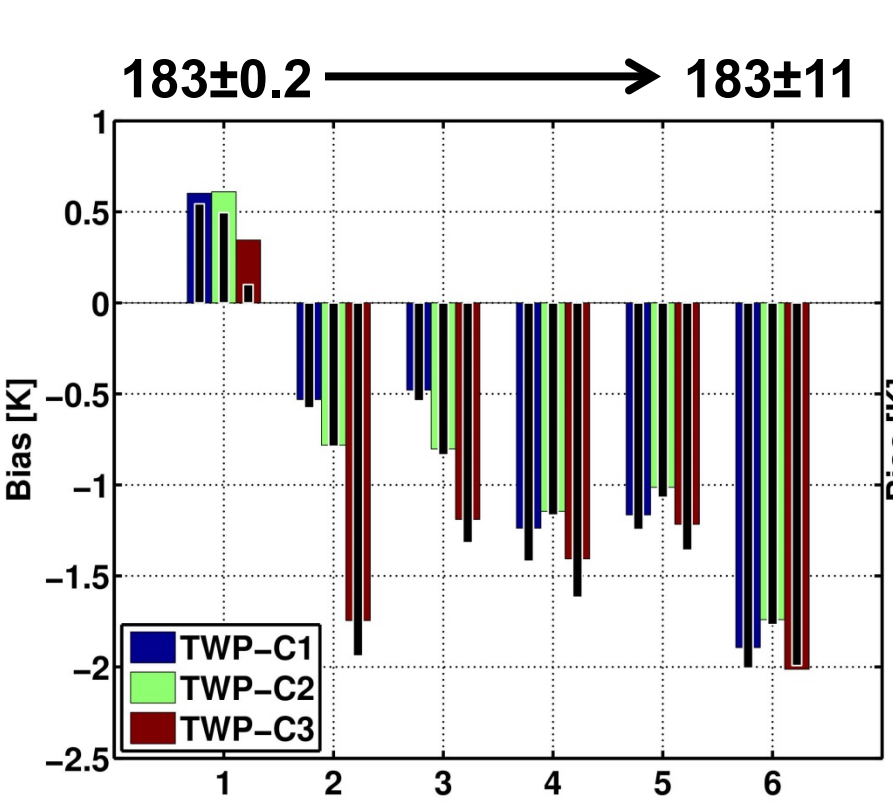




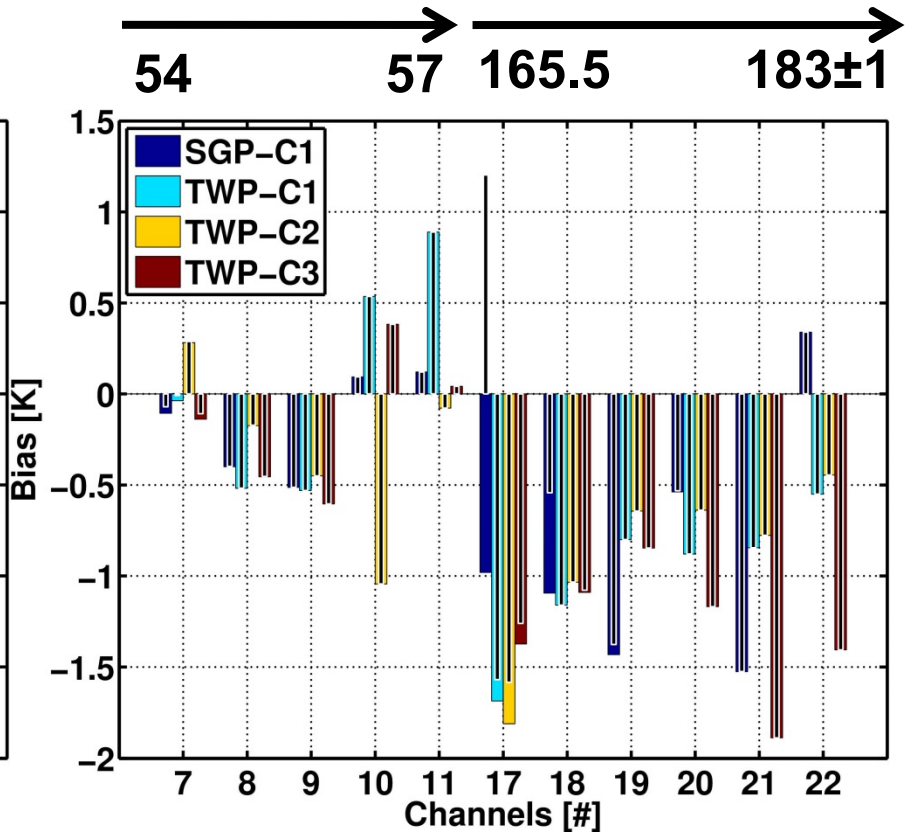
Filter for balloon drift



Validating Using ARM Data

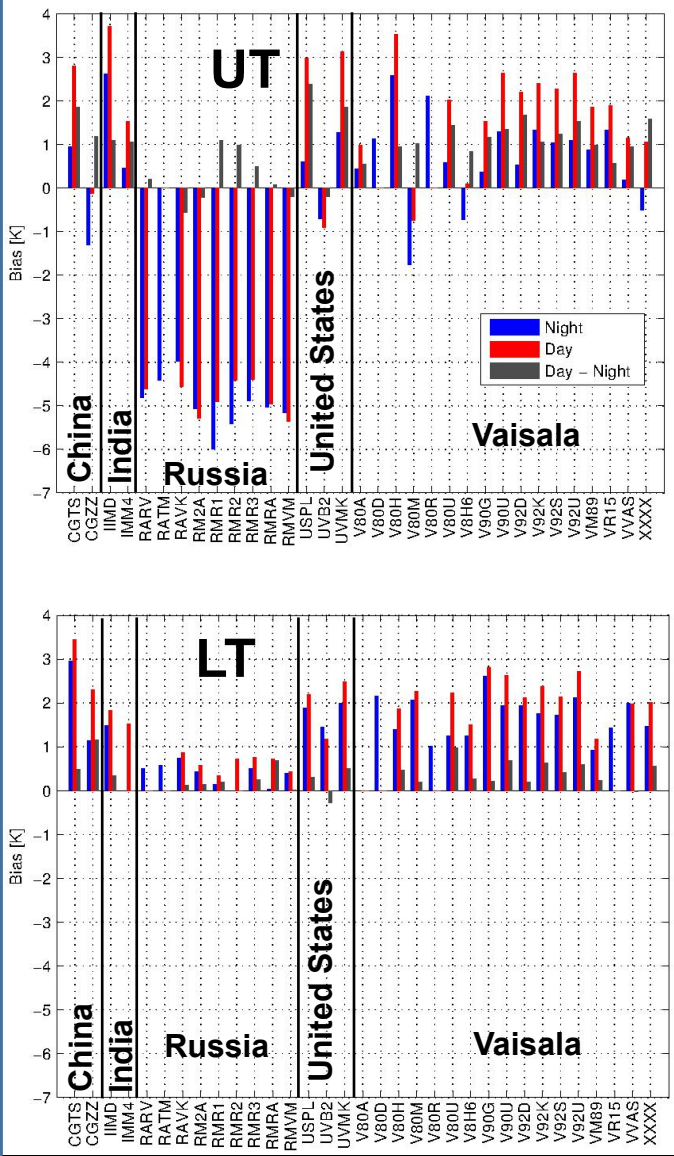


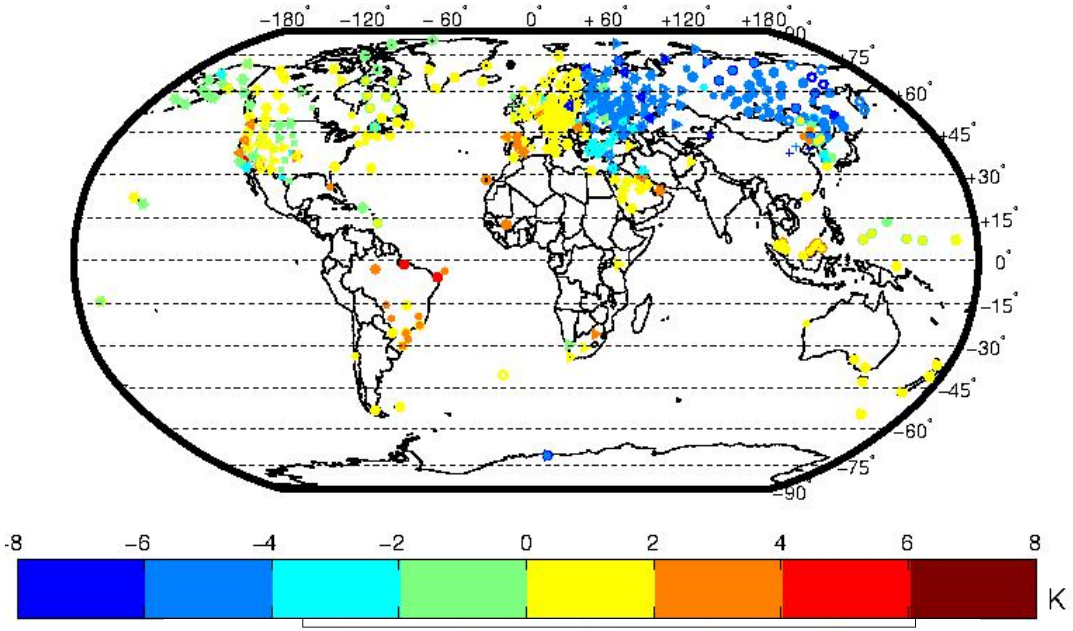
SAPHIR vs ARM

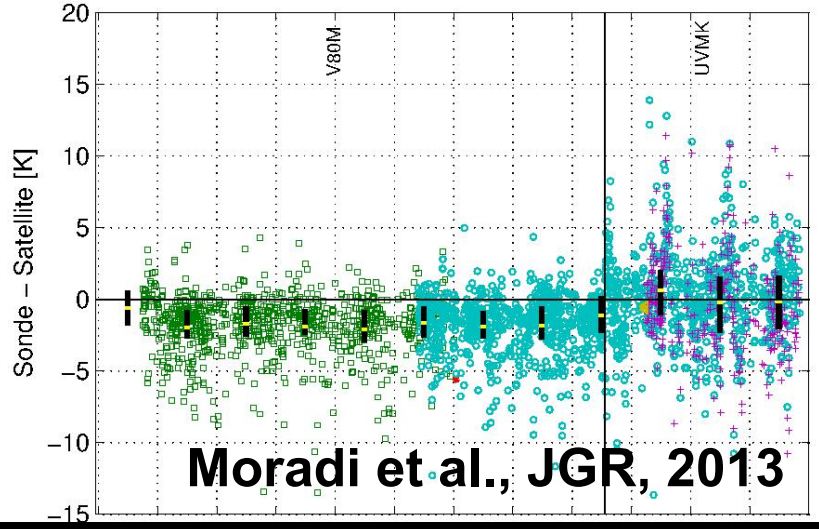


ATMS vs ARM

Error in IGRA humidity profiles

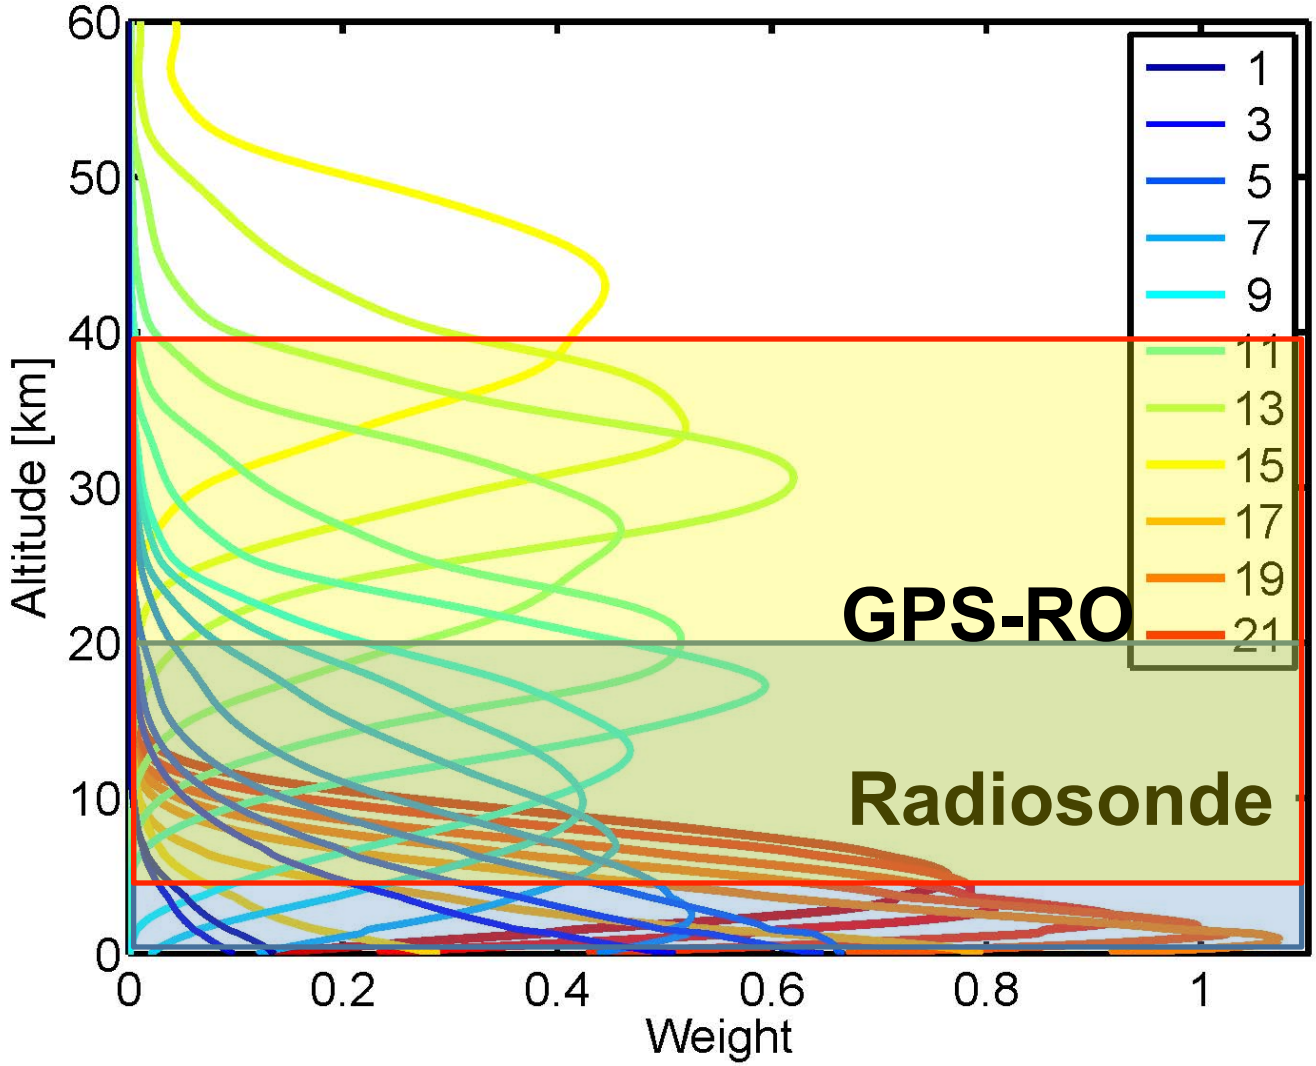






Validating using GPS-RO data

ATMS Weighting Functions



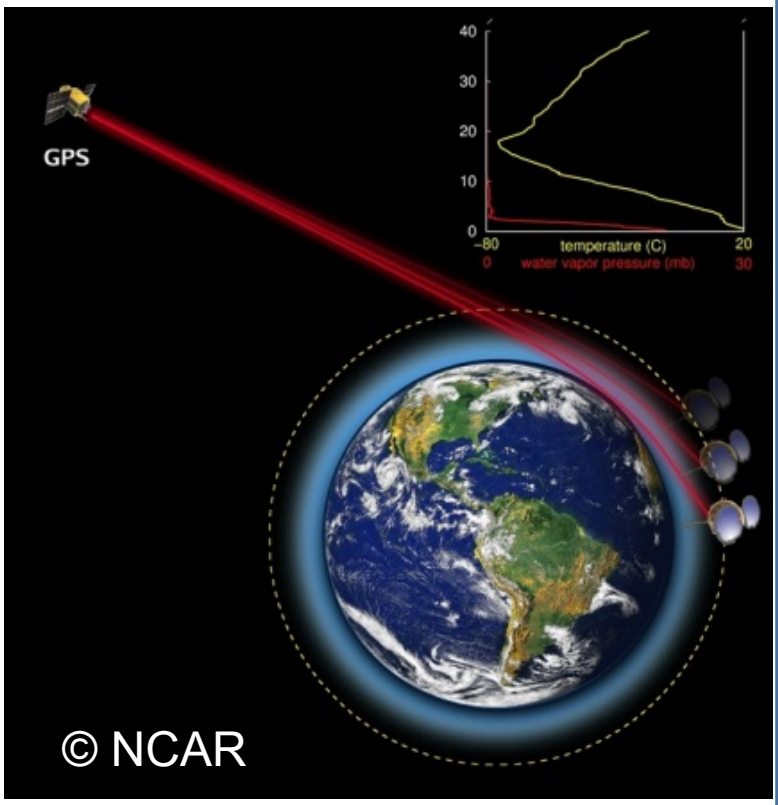
GPS Radio Occultation Data

- Radio signals transmitted by Global Positioning System (GPS) satellites are received by a receiver on a LEO satellite

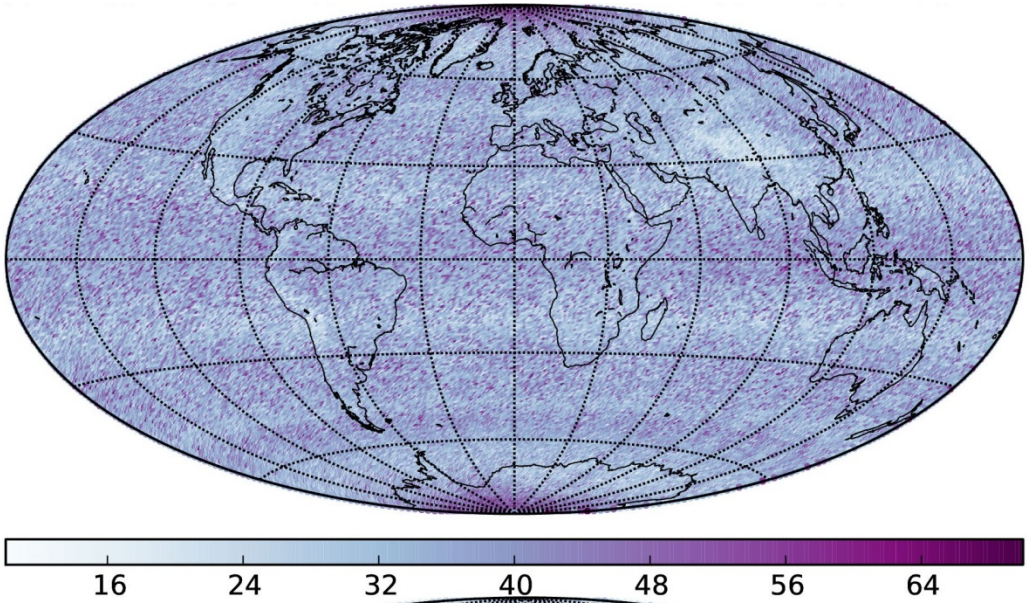
- Temperature and water vapor profiles are derived from bending angles using a-priori profiles and inversion techniques

- Raw GPS-RO data (time delay) have very high accuracy in the upper troposphere and lower stratosphere (500 hPa to 40 km) but different

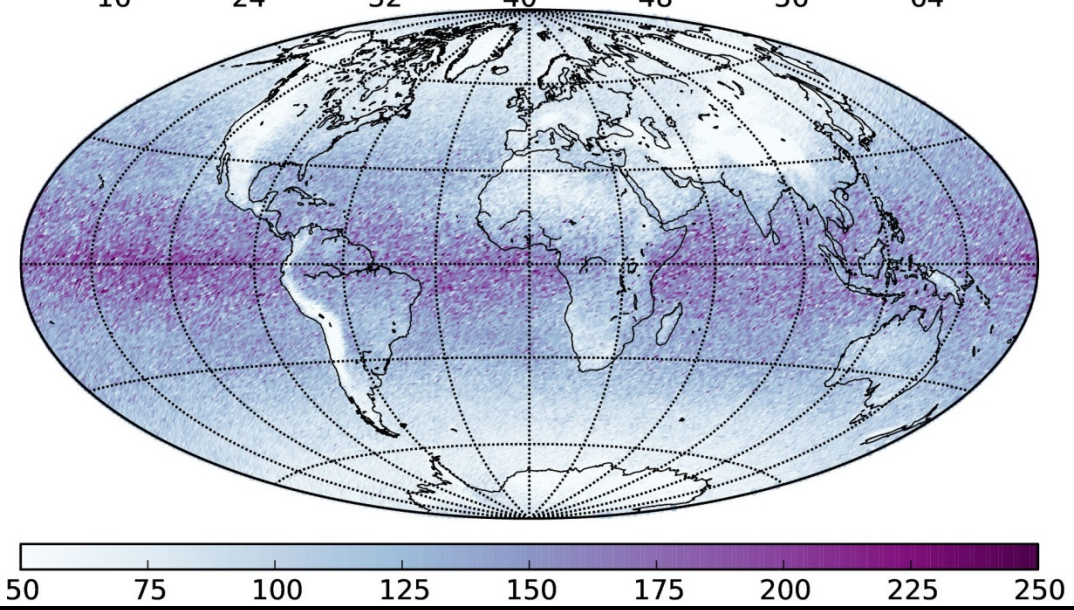
- errors and uncertainties are introduced during inversion to the atmospheric state variables



Drift in GPS Profiles

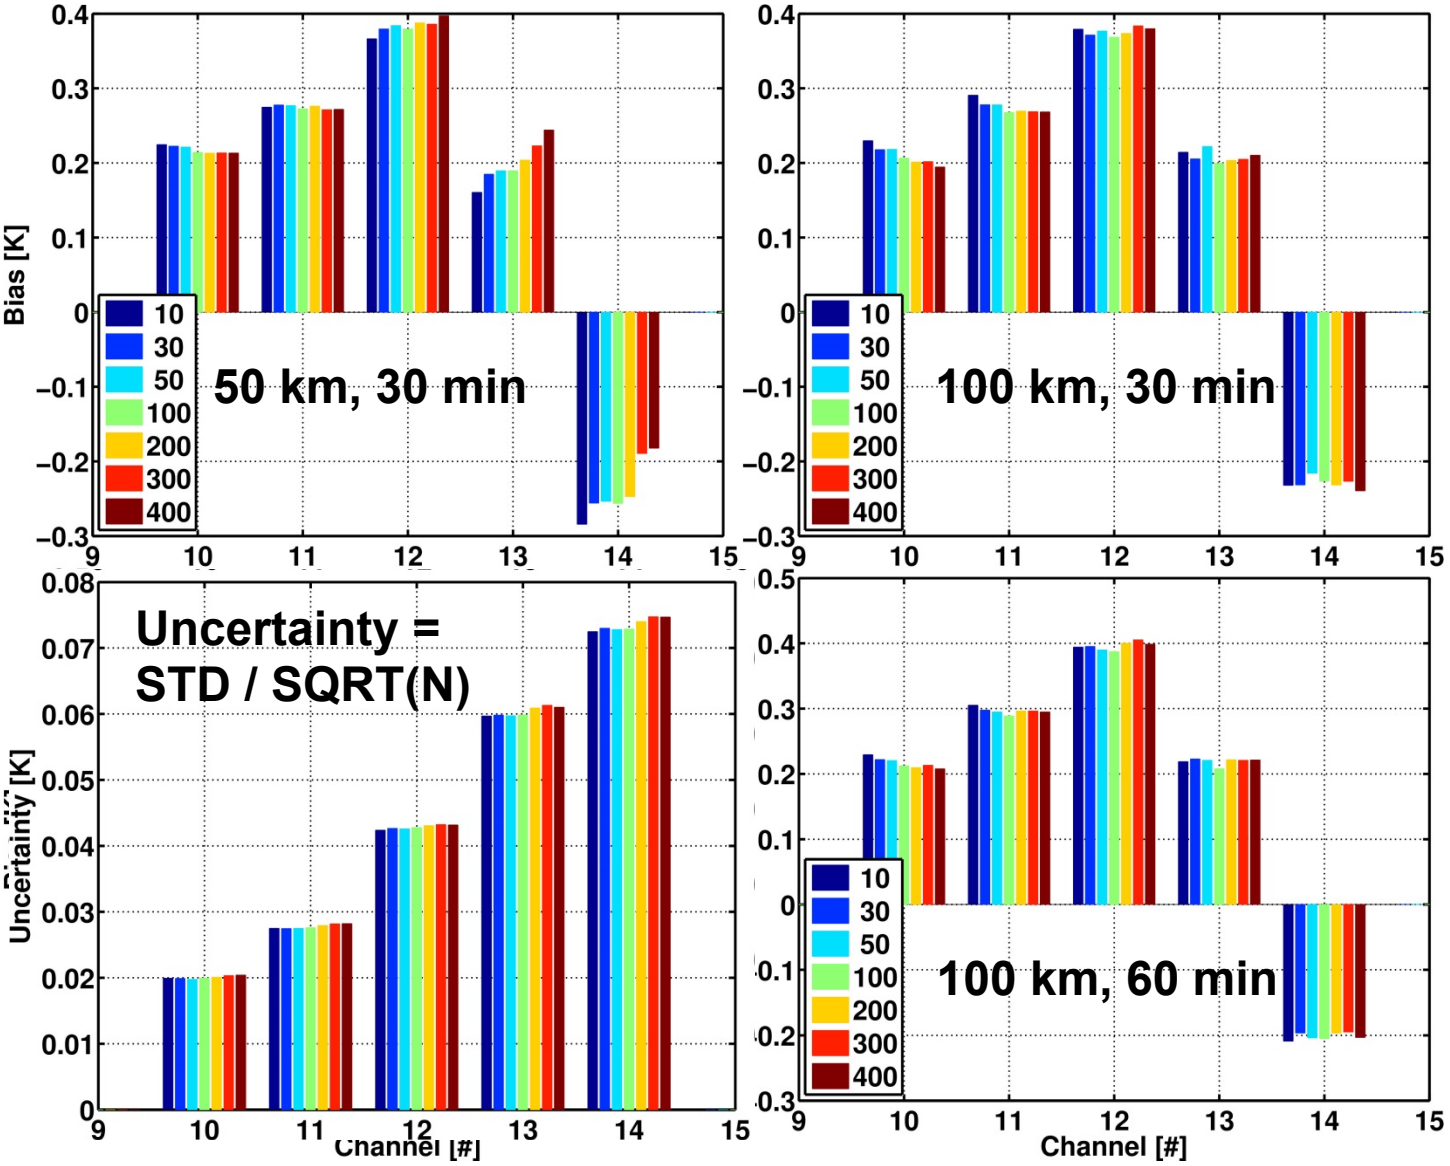


From 400 hPa to 100 hPa

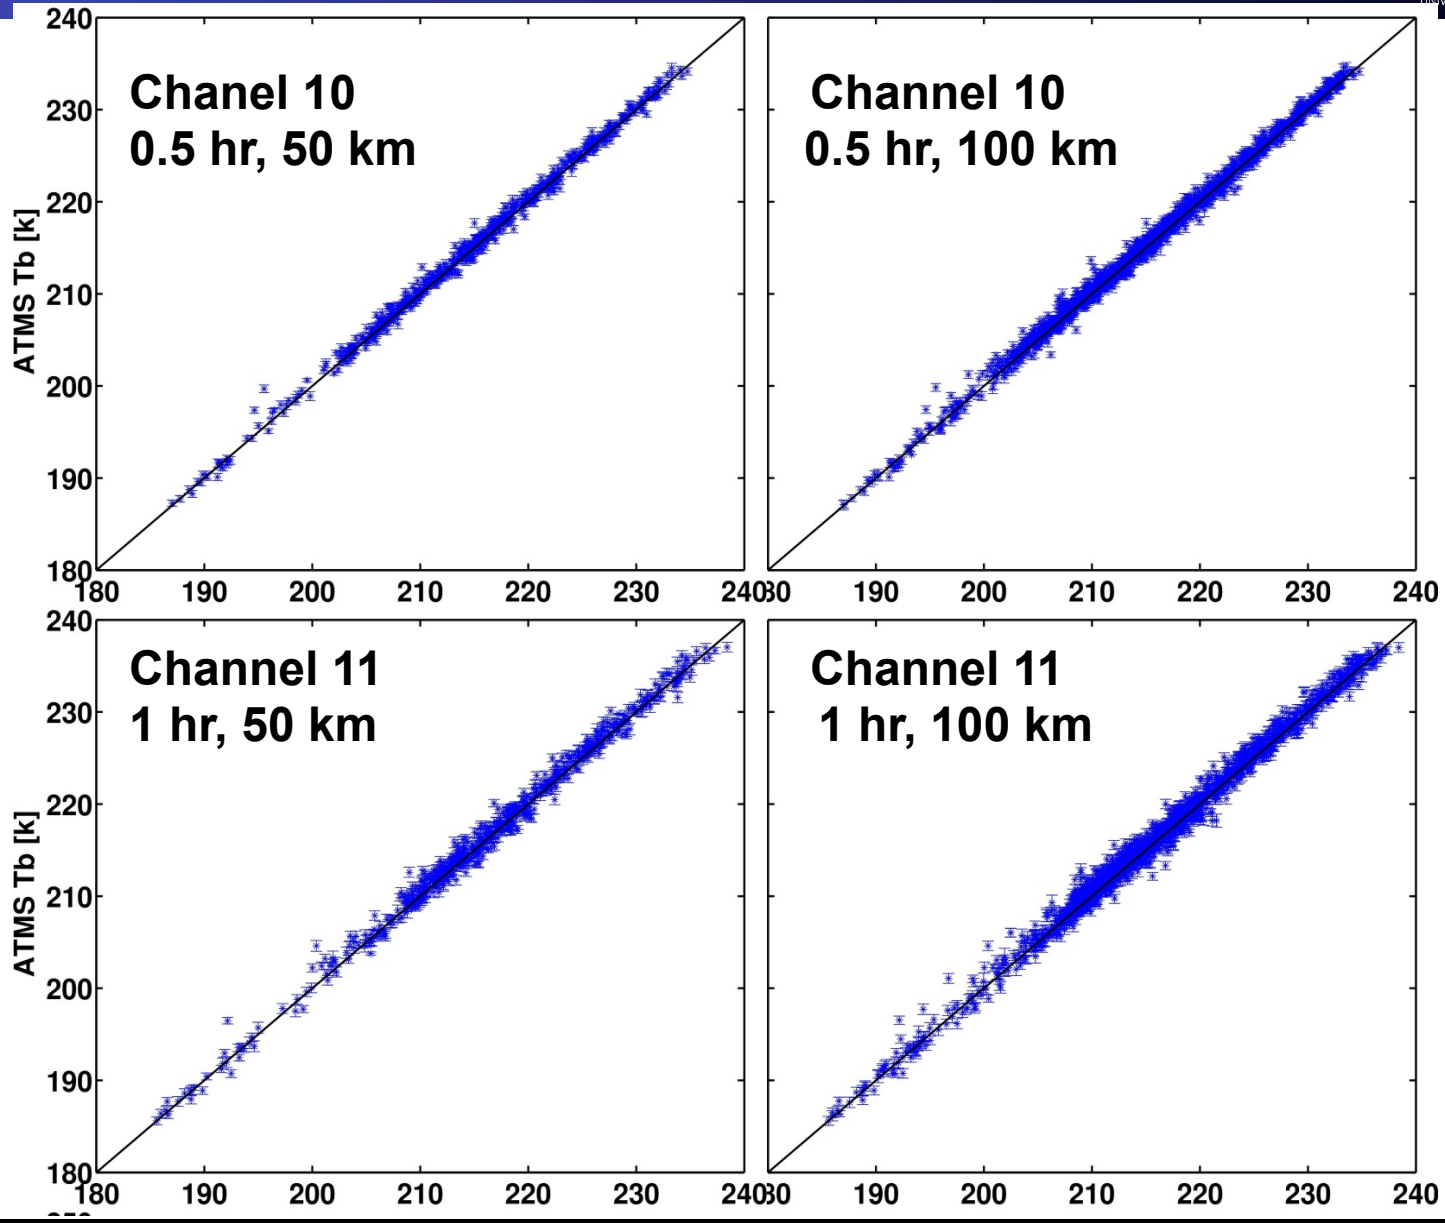


From ground To 400 hPa

ATMS vs. GPS RO



ATMS vs. GPS RO



Conclusions

- **SAPHIR and ATMS observations show very good consistency**
- **SAPHIR provides a great opportunity for inter-calibrating MW WV channels on POES satellites or to transfer the calibration among the POES satellites**
- **There is still a lack of reference datasets (identical measurements in terms of physical quanity and geometry) for validating MW satellite observations**
- **Radiosonde data can only be used to evaluate the overall bias in the WV channels and cannot precisely detect the magnitude of the bias**
- **GPS-RO data provide a good opportunity for validating observations from upper troposphere and lower stratosphere but the difference between GPS-RO and satellite observations cannot be translated as absolute bias in the satellite data**
- **The window channels cannot still be validated because of uncertainty in the surface emissivity**

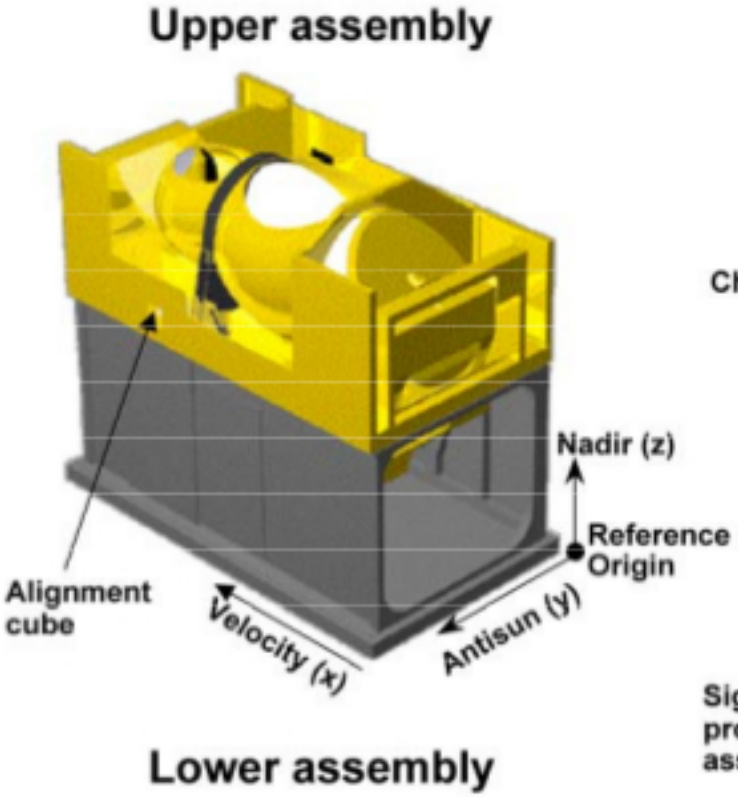
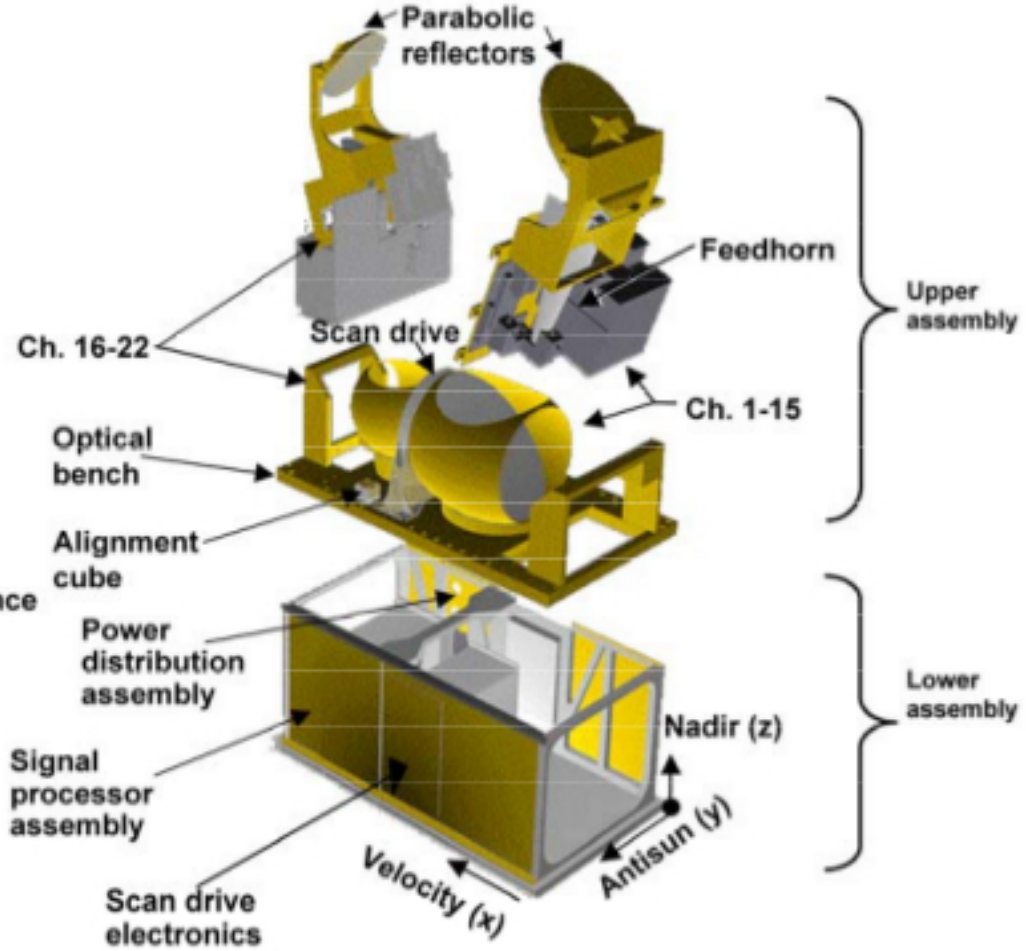
ATMS (AMSU+MHS)

- **ATMS: Advanced Technology Microwave Sounder**
- **22 channels, almost all AMSU-A and MHS plus a few additional channels**





Megha-Tropiques Orbital Characteristics ©CNES

Orbit	Altitude	Inclination	Period	#rev/day
Circular	867 km	20°	102.16 min	14

Saphir Channels

Channel N°.	Central frequencies (GHz)	Bandwidth (MHz)	radiometric sensitivity (estimated by calculation)	polarisation
