### LANDSAT-8

1

# Topics

- Landsat-8 Mission Overview and Status
  - OLI and TIRS on-orbit performance
- Landsat-8 Lunar Calibrations
- Application in OLI Radiometric Stability Performance
- Current Model Improvement Effort
- Other uses for Lunar Observations
  - TIRS Straylight Correction
- Summary

# Landsat-8 Overview

### Joint project between NASA and USGS

- NASA Instruments and spacecraft development, on-orbit checkouts, commissioning
- USGS Ground segment and postcommissioning operations

Remote Sens. 2015, 7(3)

# L8 Spacecraft Status

### All spacecraft subsystems are nominal

- ✓ <u>ACS</u>
   ✓ <u>FSW</u>
   ✓ <u>CDH</u>
- ✓ <u>EPS</u>
   ✓ <u>TCS</u>
- ✓ <u>PROP</u>
  ✓ <u>TTC</u>

OLI

All systems nominal Response change in CA band of about -1.2% Some changes in the primary onboard calibration lamps

### TIRS

A-side anomaly swap to B-side 2 – March 2015 Reflections from the internal TIRS telescope structure near the third lens caused out-of-field response at about 15° off axis (outside TIRS nominal field of view) – correction routine implemented for products

4

**OLI** Overview

- Pushbroom Radiometer, 15° FOV
- Eight 30 m multispectral bands
- One 15 m panchromatic band

Band #	Band	Center Wavelength (nm)	Bandwidth (nm)	Lower Band Edge (nm)	Upper Band Edge (nm)
1	Coastal/Aerosol	443.0	16.0	435.0	451.0
2	Blue	482.0	60.0	452.0	512.1
3	Green	561.4	57.3	532.7	590.1
4	Red	654.6	37.5	635.9	673.3
5	NIR	864.7	28.3	850.5	878.8
6	SWIR 1	1608.9	84.7	1566.5	1651.2
7	SWIR 2	2200.7	186.7	2107.4	2294.1
8	Panchromatic	589.5	172.4	503.3	675.7
9	Cirrus	1373.4	20.4	1363.2	1383.6

### **Calibration Devices**

- On-board lamps
- Solar diffuser

5

• Lunar

# **OLI** Performance

### Precision of Calibrator Data (approximate range)

Calibrator	Coastal Aerosol	Red	NIR	SWIR-1	SWIR-2
Lamp	±0.15%	±0.02%	±0.01%	±0.01%	±0.01%
Solar	±0.10%	±0.05%	±0.05%	±0.05%	±0.05%
Lunar	±0.10%	±0.10%	±0.10%	±0.50%	±0.30%

# **OLI Calibration Stability**

11/14/17

# **TIRS Instrument Overview**

- 4 optical element refracting telescope
- Focal plane consists of 3 staggered QWIP arrays
- Two spectral channels: 10.6 μm - 11.2 μm known as "Landsat 8 band 10" 11.5 μm - 12.5 μm known as "Landsat 8 band 11"
- Dark band to monitor focal plane drift
- Push-broom configuration: ~1850 detectors acrosstrack per band
- 185 km ground swath (15 degree); 100 meter pixel size on ground;

resampled to 30 meter pixels in final product

 For calibration purposes, a Scene Select Mechanism (SSM) can switch instrument view between:

Nadir – Deep Space Port – Blackbody Calibrator (OBC)

• Noise characterization based on collects of OBC

11/14/17

NEdL @ Source temperature of 295K

# Landsat-8 Status Summary

- Landsat-8 has been exceeding expectations in terms of data quantity and quality
  - currently acquires up to 740 images per day requirements are 400 per day.
- OLI has been extremely stable on-orbit
  - At most 1% change is band average response in Band 1, Coastal Aerosol (CA)
    - variation between the calibration sources is ~0.2%
  - All calibration techniques working and consistent
    - Increase in "brightness" of working diffuser relative to other calibrators
    - Larger scatter in lunar response in SWIR bands, particularly SWIR-1 and Cirrus
    - OLI reflectance absolute calibration generally consistent to 3% with vicarious techniques
  - Small detector to detector variations (generally sub 0.1%) that are well corrected
  - SNR performance 2-3 times requirements
  - 100% detector operability
- TIRS has been extremely stable on-orbit
  - At most 0.5% change in band average response
  - Noise ~8 times better than requirements
  - 100% detector operability
  - Stray light compromises image uniformity and absolute calibration; adequately corrected in band 10 for many applications with simple bias factor

# Landsat-8 Lunar Calibrations

Based on experience on EO-1 (ALI & Hyperion instruments) since 2001\*

- Lunar Cals are performed monthly between 5 and 9 deg lunar phase angle
  - The moon is imaged by a spacecraft pitch motion.
  - The pitch rate is constant and well controlled during the imaging interval.
  - Roll and Yaw rates are negligible.
  - Orientation of the scan is such that the bright limbs are at the top and bottom of the image. This provides better estimates of the lunar y-size
- Irradiance values of the lunar image are integrated and compared to the Rolo model.
  - Image is filtered to remove stars and other artifacts
  - No further background correction beyond those in the L1R process.

### **Development of SLIM Lunar Irradiance Model**

![](_page_12_Picture_1.jpeg)

Hugh H. Kieffer Celestial Reasonings hhkieffer@gmail.com 775-782-0767

- Spacecraft and Earth-based Lunar Irradiance Model, SLIM
- Support any bands in the 330-2500 nm region
- Based on as many spacecraft as possible
- Follow many of the concepts used by be ROLO
- But, treat ROLO data as just another instrument (current effort uses version 3)
- Use a structure that can readily incorporate additional instruments

There is only one Moon We need to develop our best estimate of what it is

![](_page_12_Picture_10.jpeg)

# On-going model improvement effort

### Modeling considerations -

1. Spectral coverage of model input data

![](_page_13_Figure_3.jpeg)

![](_page_13_Picture_4.jpeg)

# **Model Considerations - continued**

### Phase angle coverage

![](_page_14_Figure_2.jpeg)

![](_page_14_Picture_3.jpeg)

![](_page_14_Picture_4.jpeg)

# Model considerations- continued

### Libration coverage

![](_page_15_Figure_2.jpeg)

![](_page_15_Picture_3.jpeg)

![](_page_15_Picture_4.jpeg)

# Very preliminary results

![](_page_16_Figure_1.jpeg)

Current Rolo model

Using only OLI, Hyperion, MODIS and VIIRS Does not include non-linear terms, eg the phase angles, residuals for solar longitude, etc.

![](_page_16_Figure_4.jpeg)

Wavelength [nm]

![](_page_16_Picture_6.jpeg)

![](_page_16_Picture_7.jpeg)

# Very preliminary SLIM results

Using only OLI, Hyperion, MODIS and VIIRS Does not include non-linear terms, eg the phase angles, residuals for solar longitude, etc.

### Input Data/SLIM Input

Continuous wavelength coefficients

![](_page_17_Picture_4.jpeg)

![](_page_17_Picture_5.jpeg)

# Philosophic Issues/Future work

- How to adjust for large differences in the number of data points for an instrument,
  - ROLO: 1239, 32 bands each
  - OLI: 675, 9 bands
  - Hyperion: 20, 196 bands reduced to 26
  - MODIS-Aqua: 53, 12 bands provided
  - VIIRS: 27, 14 bands
- How to account for the different uncertainties among the datasets
  - Use calibration residual level to refine the uncertainty for next iteration.
- How to join the band-by-band results spectrally in a plausible manner.
  - Lab measurements of the Lunar photometric properties are smooth across wavelengths
  - The first attempt yielded promising results
- Incorporate other datasets including those from GOES, Pleiades, and others who would like to contribute to the effort.

![](_page_18_Picture_13.jpeg)

# Other uses for Lunar Observations

![](_page_19_Figure_1.jpeg)

![](_page_19_Picture_2.jpeg)

![](_page_19_Picture_3.jpeg)

# Image artifacts indicate straylight issue

### Two major artifacts:

1. Non-Uniform Banding

![](_page_20_Picture_3.jpeg)

![](_page_20_Figure_4.jpeg)

### 2. Absolute Calibration Error

![](_page_20_Picture_6.jpeg)

## Lunar raster scan definitively showed stray light

- Raster-scan the moon around the out-of-field
- Should see "nothing" when moon is outside field-of-view

![](_page_21_Figure_3.jpeg)

![](_page_21_Picture_4.jpeg)

![](_page_21_Picture_5.jpeg)

![](_page_21_Picture_6.jpeg)

## Map of stray light locations from lunar positions

![](_page_22_Figure_1.jpeg)

![](_page_22_Figure_2.jpeg)

Lunar locations (blue) in which a stray light signal appeared <u>anywhere</u> on the detectors

![](_page_22_Picture_4.jpeg)

![](_page_22_Picture_5.jpeg)

### Reverse ray trace produces stray light map for each detector

![](_page_23_Figure_1.jpeg)

\* Unique PSF for each detector (i.e.- different stray light signal for every detector)

11/14/17

## Stray light removal algorithm: Optical model with out-of-field data

![](_page_24_Figure_1.jpeg)

11/14/17

2nd GSICS Lunar Calibration Workshop, Xian, China

## Stray light removal algorithm: Optical model with TIRS data only

![](_page_25_Figure_1.jpeg)

![](_page_25_Picture_2.jpeg)

![](_page_25_Picture_3.jpeg)

### Stray light correction with and without out-of-field knowledge

![](_page_26_Figure_1.jpeg)

### **Full Scene Correction Validation**

- During L8/Terra underfly period, TIRS centered on MODIS field-of-view
- Compare TIRS current product and corrected product to Terra/MODIS for all of the following locations:

![](_page_32_Picture_3.jpeg)

## **Correction Algorithm Summary**

- Algorithm uses only TIRS interval data (no other sensor data) with optical model
- Able to be run in "real time" (i.e.- no significant processing lag) to produce corrected TIRS scenes
- Significant issues with external sensor (e.g. GOES) data limit its utility:
  - Band shape
  - View angle
  - cross-cal between sensors required for global coverage
- TIRS-on-TIRS was implemented into USGS ground processing system. Products available through "Landsat 8 Collection 1" data archive.
- Validated correction using Terra/MODIS data during the Terra/Landsat 8 under-flight period following launch.

![](_page_34_Picture_9.jpeg)

# Summary

- Landsat-8 approaching 5 years of service
- OLI-2 is stable
  - Good agreement among all calibration devices
  - Higher uncertainty for the SWIR bands in the lunar data
- On-going effort to improve the model for both relative and absolute radiometry
  - Developing algorithms to incorporate differences among the instruments/data sources.
- Lunar observations was useful to examine and diagnose image artifacts in both the OLI and, especially for the TIRS
  - Straylight correction routine for successfully incorporated in the Landsat-8 TIRS image products.
